ADEVA®

Graphical Monitoring Software
FCEGRAPH

Overview

- Compatible with protocol Intelligent
- Intuitive control screen layout
- Fire System Management tools
- Fire locations shown on multi level map
- Print location map
- Multiple users with individual passwords
- Simple and user friendly
- Full design / layout control

Description

The FCEGRAPH Graphical Monitoring software was designed with the purpose of making fire system management easier. A simple yet effective solution providing both alarm management and system maintenance tools.

This design enables workstations to be configured, matching the exact layout of the installation, right down to the last individual device. This level of detail facilitates instant understanding of the system in a single glance. Users can be provided with access to a defined level of functions through individual passwords. An independent log is maintained recording system activity and user activity.

Any incoming alarm is indicated audibly and visually drawing the user's attention. The resulting conditions are indicated in the status bar, right down to the individual device alarm level.

All the information is available on a single screen allowing quick assessment, whilst any actions can be taken by accessing the builtin menus. Building Evacuation, Alarm Silencing and Reset are available to any users with suitable security clearance.
